

A Single-Page Test for Translation

This is a single-page English document created to test the translation feature with minimal API cost. It contains several sentences of varying length and structure. As shown in Fig. 3, the proposed method converges within a few hundred steps. Prior work by Smith et al. established a comparable baseline on the same benchmark. When the learning rate is set to 0.01, the training loss decreases monotonically and stabilizes around 0.12. Sentences in real papers often wrap across multiple lines, as this sentence does, which exercises the offset matching between the extracted text and the translated sentences. We omit a full experimental evaluation here; the reader should focus on whether each sentence becomes clickable and shows a Chinese translation. This is the final sentence of the test document.
